

# New biomarkers for post-surgery follow-up of CE patients

**Coralie BARRERA & Louis BOHARD**  
**Karima Achour / Laurence Millon /**  
**Maria Mar SILES LUCA**

# Introduction & objectives

Elevated relapse after surgery 4.6% – 22 % (Kapan 2006; Prousalidis 2012; Sielaff 2001)  
Even if combined with antihelminthic treatments (Velasco-Tirado, 2017)

Gold standard = ultrasound scan

Current/commercially immunoassays : Antibodies elevated for a longtime.  
No early serological assays availables to detect relapse.

Follow-up CE : Many approaches tested : antibodies, cytokines, parasitic antigens.

Recombinant Antigens **B2T & 2B2T** : promising biomarkers for follow-up but large number of pre-operatively non-responsive CE cases. (Hernandez-Gonzalez 2018)

A peak in immune and serological responses in many cases shows up at 1 month after surgical treatment of CE (Ben Nour 2009; 2008)

# Introduction & objectives

Follow-up CE : Many approaches tested : antibodies, cytokines, parasitic antigens.

Recombinant Antigens **B2T & 2B2T** : promising biomarkers for follow-up but large number of pre-operatively non-responsive CE cases. (Hernandez-Gonzalez 2018)

A peak in immune and serological responses in many cases shows up at 1 month after surgical treatment of CE (Ben Nour 2009; 2008)

% of patients with  
negativization

Significative decrease for iterative  
comparison

Iterative comparison  
between  
Ab levels at M1  
and Ab levels at M12

More informative for  
the follow-up than a  
positivity cut-off

## RESEARCH

## Open Access

# Promising proteins detected by Western blot from *Echinococcus granulosus* protoscoleces for predicting early post-surgical outcomes in CE-affected Tunisian children

Eya Ben Salah<sup>1</sup>, Coralie Barrera<sup>2</sup>, Sana Mosbahi<sup>3</sup>, Bruno Gottstein<sup>4</sup>, Mar Siles-Lucas<sup>5</sup>, Samia Belhassen<sup>3</sup>, Abdellatif Nouri<sup>3</sup>, Hamouda BABBA<sup>1</sup>, Laurence Millon<sup>2</sup> and Wahiba Sakly<sup>1\*</sup>

**Table 2** Number of CE patients according to the evolution of IgG levels observed between D030 and D365 for anti-B2t, anti-2B2t, and both antibodies (2B2t or B2t), and determination of the probability of being relapse-free

Antibody response	Evolution	NRCE, n (%)	RCE, n (%)	Probability of being relapse-free (%)
Anti-B2t IgG	Decrease*	25 (64)	6 (30)	81
	Increase	5 (13)	8 (40)	
	Stability	9 (23)	6 (30)	
Anti-2B2t IgG	Decrease	21 (54)	7 (35)	75
	Increase	9 (23)	10 (50)	
	Stability	9 (23)	3 (15)	
Anti-(B2t or 2B2t) IgG	Decrease*	32 (82)	9 (45)	78
	Increase	4 (10)	7 (35)	
	Stability	3 (8)	4 (20)	

NRCE non-relapsed patients, RCE relapsed patients

\* $p < 0.05$  (chi-square test)

Novel biomarkers for the early prediction of pediatric cystic echinococcosis post-surgical outcomes

Eya Ben Salah<sup>a,b,c</sup>, Coralie Barrera<sup>b,c</sup>, Wahiba Sakly<sup>a</sup>, Sana Mosbahi<sup>d</sup>, Thierry Balliau<sup>e</sup>, Nathalie Franche<sup>c</sup>, Bruno Gottstein<sup>f</sup>, Sabine Ben Youssef<sup>d</sup>, Mongi Mekki<sup>d</sup>, Hamouda Babba<sup>a</sup>, Laurence Millon<sup>b,c,\*</sup>

Abundance of immunoreactive-proteins - Comparison strategy

**Table 1**  
Evolution of IgG levels between 1 M and 1Y post-surgery in NRCE and RCE patients.

IgG antibody response against	Evolution	NRCE; n (%)	RCE; n (%)	Chi-square test	Probability of being “relapse-free” at 1Y <sup>a</sup>	Probability of being “relapsed” at 1Y <sup>b</sup>
Eg-cMDH	Decrease	25 (56)	6 (23)	<b>p = 0.02</b>	<b>83%</b>	<b>64%</b>
	Increase	5 (15)	8 (54)	<b>p = 0.01</b>		
	Stability	9 (29)	6 (23)	Ns		
Eg-CS	Decrease	22 (65)	5 (29)	<b>p = 0.01</b>	<b>81%</b>	57%
	Increase	3 (9)	4 (24)	Ns		
	Stability	9 (26)	8 (47)	Ns		
Eg-ANX A6	Decrease	15 (44)	6 (35)	Ns	71%	54%
	Increase	6 (18)	7 (41)	Ns		
	Stability	13 (38)	4 (24)	Ns		
Eg-SVN	Decrease	18 (53)	7 (41)	Ns	72%	33%
	Increase	4 (12)	2 (12)	Ns		
	Stability	12 (35)	8 (47)	Ns		

<sup>a</sup> The probability of being “relapse-free” was calculated as follows: number of NRCE with a decreased level between 1 M and 1Y/number of all patients (NRCE and RCE) with the same status.

<sup>b</sup> The probability of being “relapsed” was calculated as follows: number of RCE with an increased level between 1 M and 1Y/number of all patients (NRCE and RCE) with the same status.

# Introduction & objectives

Elevated relapse after surgery 4.6% – 22 % (Kapan 2006; Prousalidis 2012; Sielaff 2001)  
Even if combined with antihelminthic treatments (Velasco-Tirado, 2017)

Gold standard = ultrasound scan

Current/commercially immunoassays : Antibodies elevated for a longtime.  
No early serological assays availables to detect relapse.

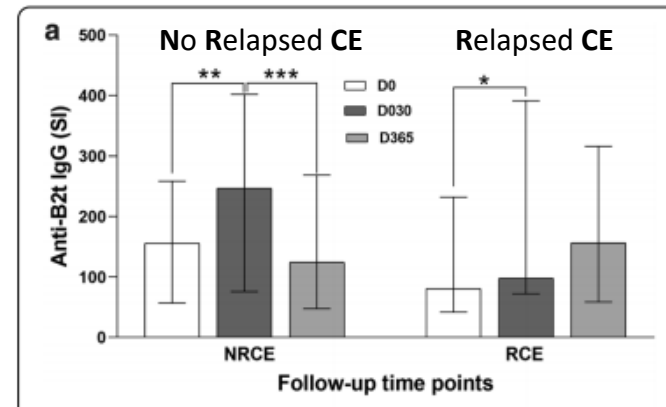

Follow-up CE : Many approaches tested : antibodies, cytokines, parasitic antigens.

Recombinant Antigens **B2T & 2B2T** : promising biomarkers for follow-up but  
large number of pre-operatively non-responsive CE cases. (Hernandez-Gonzalez 2018)

**OBJECTIVES** : Performed ELISA with both new biomarkers, B2T & 2B2T and the currently used in Besançon lab the *Echinococcus granulosus* IgG ELISA kit from Bordier affinity products (Switzerland)  
Evaluated the antibodies kinetics and predictive performance of relapse/no relapse

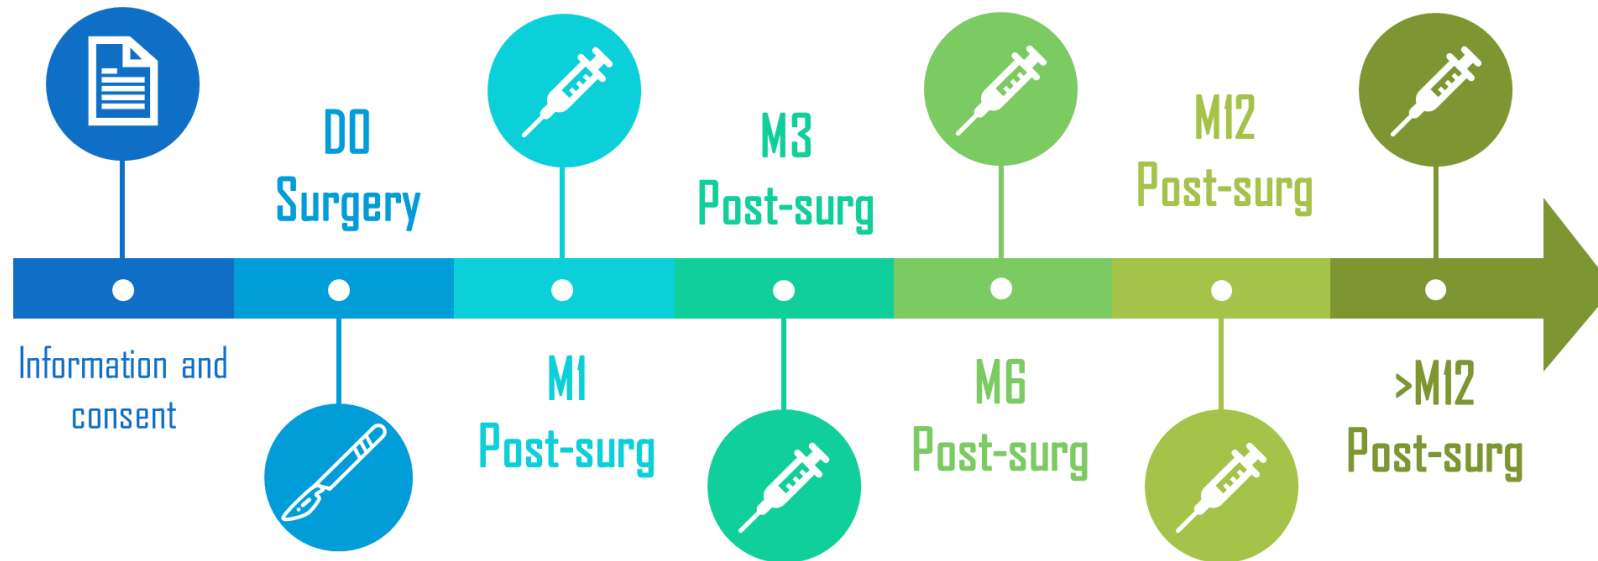

Demonstrated on  
paediatric CE population

Recruitment D0 : since january 2022 -> March 2023 = 23 patients

From Algeria

Blood samples collection plan:

Only 16 patients on 23 have the three samples : D0 + M1 + M12

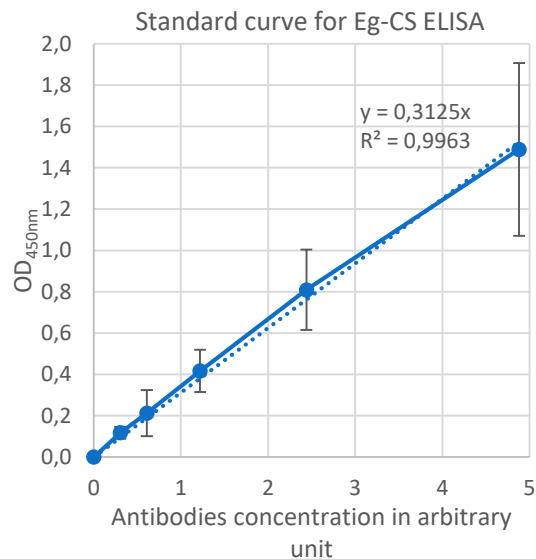

21 patients had the samples D0 + M12

## In-house ELISA with Eg-MDH ; Eg-CS; B2T ; 2B2T

samples Wilcoxon test;  
directional hypothesis  
Measure 1 > Measure 2

Significant decrease  
in antibody levels

- ↑ One pulmonary cyst completely removed
- ↑ One cyst (liver or other) completely removed
- ↑ Two cysts (one liver and one lung) completely removed
- ↑ Two cysts (one liver and one lung) **NOT** completely removed
- ↑ Nine pulmonary cysts **NOT** completely removed
- ★ History of CE

5 were negative at D0 (26.3%) :

3 positives became negatives after M12 (15.7%)

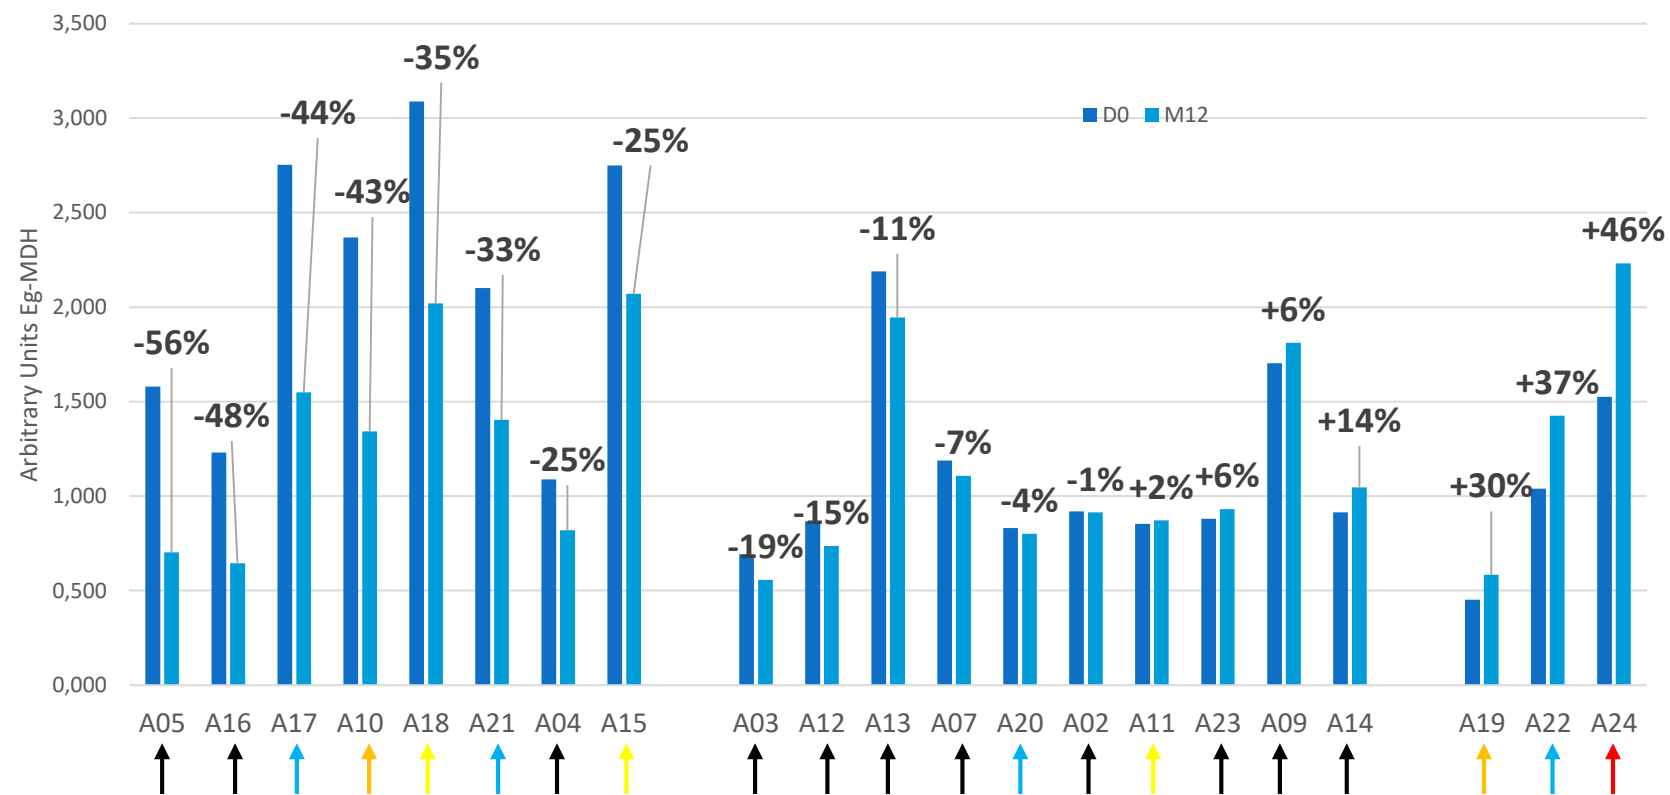

11 remain positives (58%)

16 decrease at least of -20% (84%)  
3 kept stables [-20% : +20%] (16%)

A12 and A13 with decrease <-50% :

Weak antibody levels or important decrease =  
Relatively simple CE cases  
Clinical board consistent with serological findings

## ELISA results – Malate dehydrogenase

- ↑ One pulmonary cyst completely removed
- ↑ One cyst (liver or other) completely removed
- ↑ Two cysts (one liver and one lung) completely removed
- ↑ Two cysts (one liver and one lung) **NOT** completely removed
- ↑ Nine pulmonary cysts **NOT** completely removed
- ★ History of CE

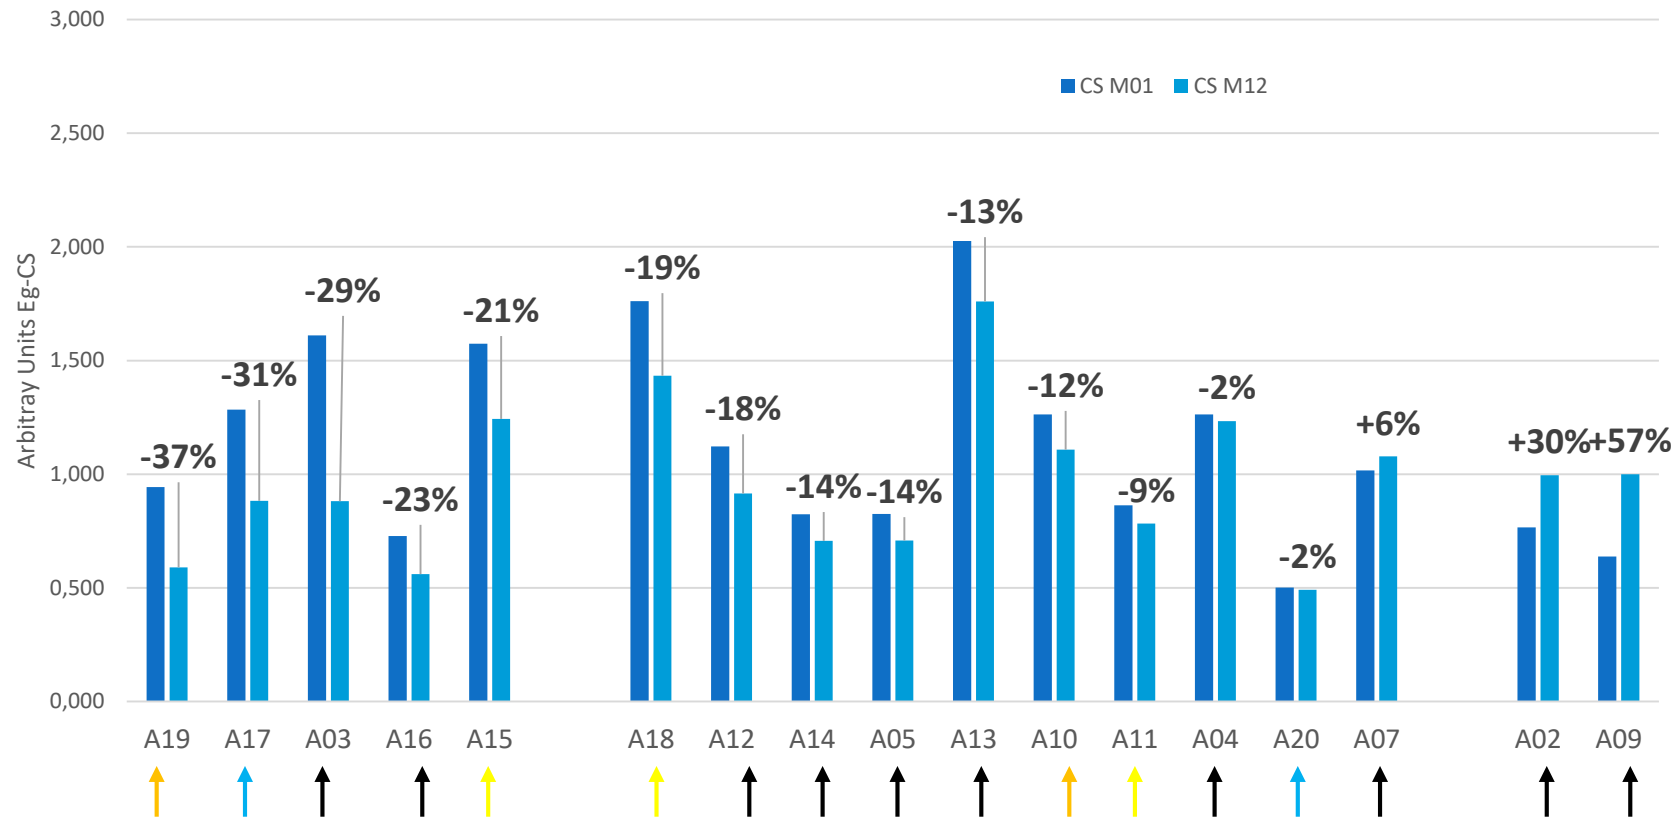

8 patients (38%)  
with decrease < -20%

10 patients (48%)  
with stability

3 patients (14%) with  
increase > +20%

# Results

## ELISA results – Citrate synthase

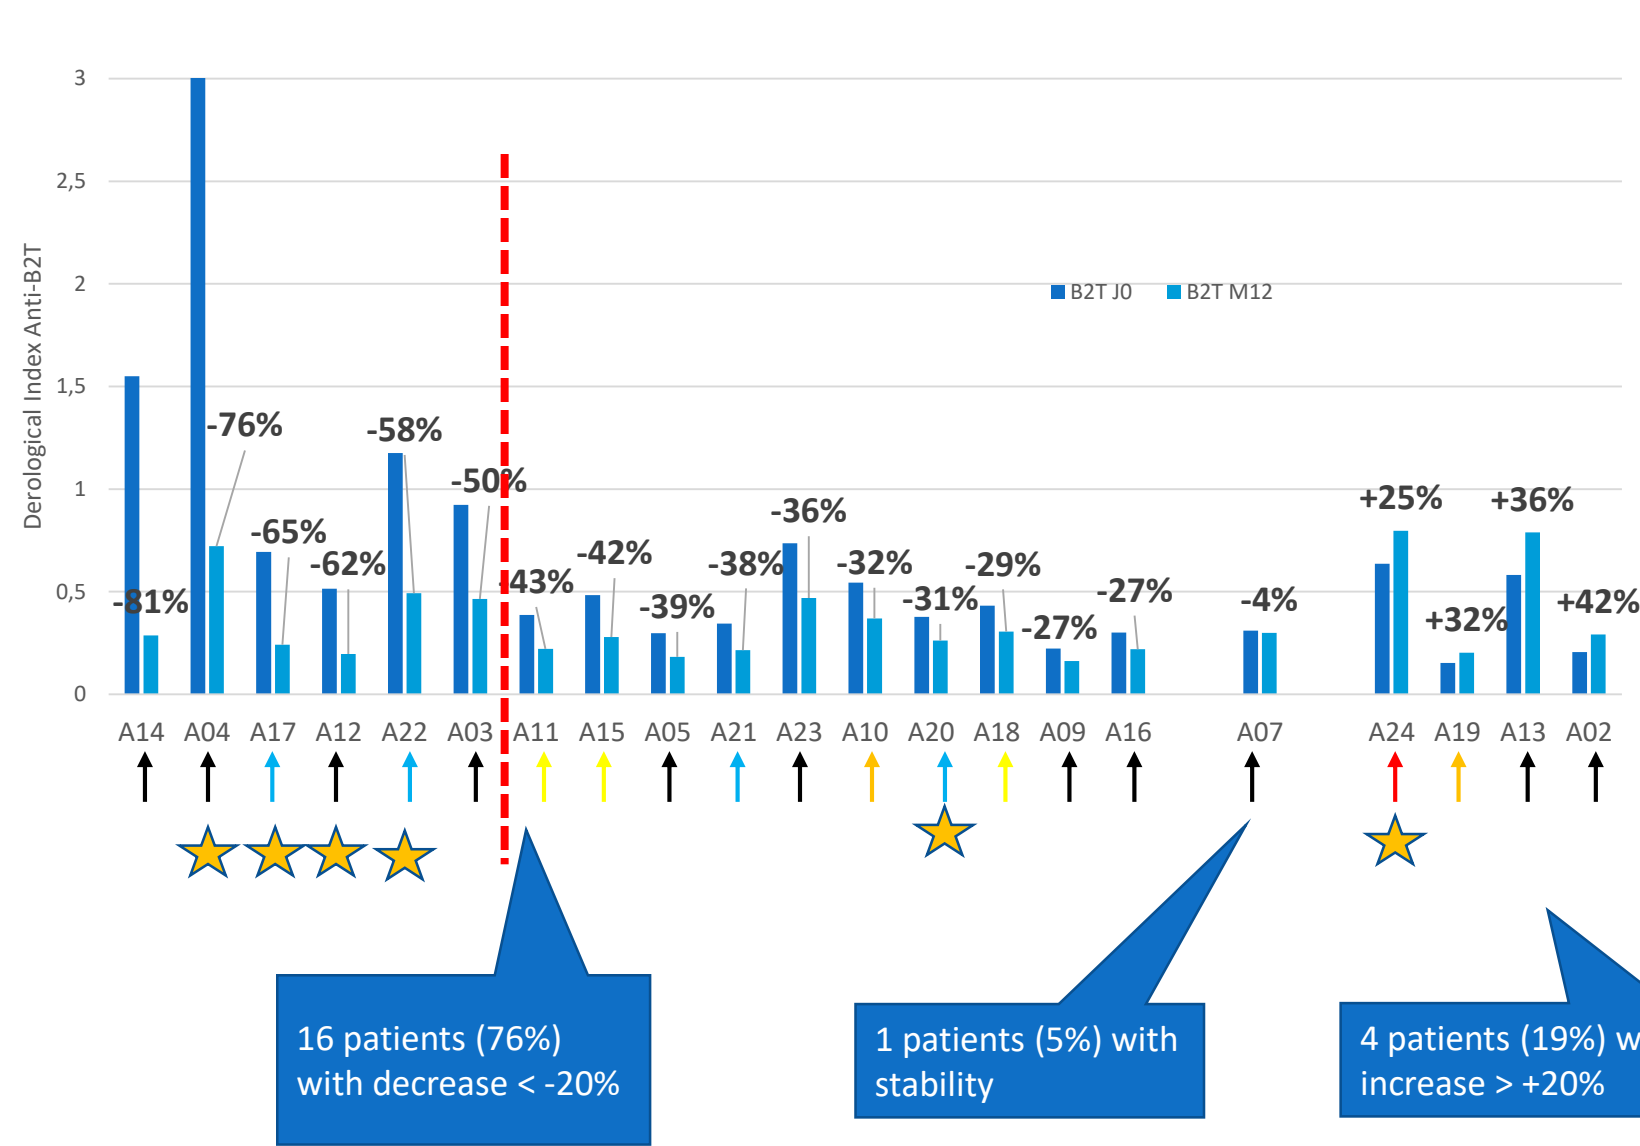

- ↑ One pulmonary cyst completely removed
- ↑ One cyst (liver or other) completely removed
- ↑ Two cysts (one liver and one lung) completely removed
- ↑ Two cysts (one liver and one lung) **NOT** completely removed
- ↑ Nine pulmonary cysts **NOT** completely removed
- ★ History of CE

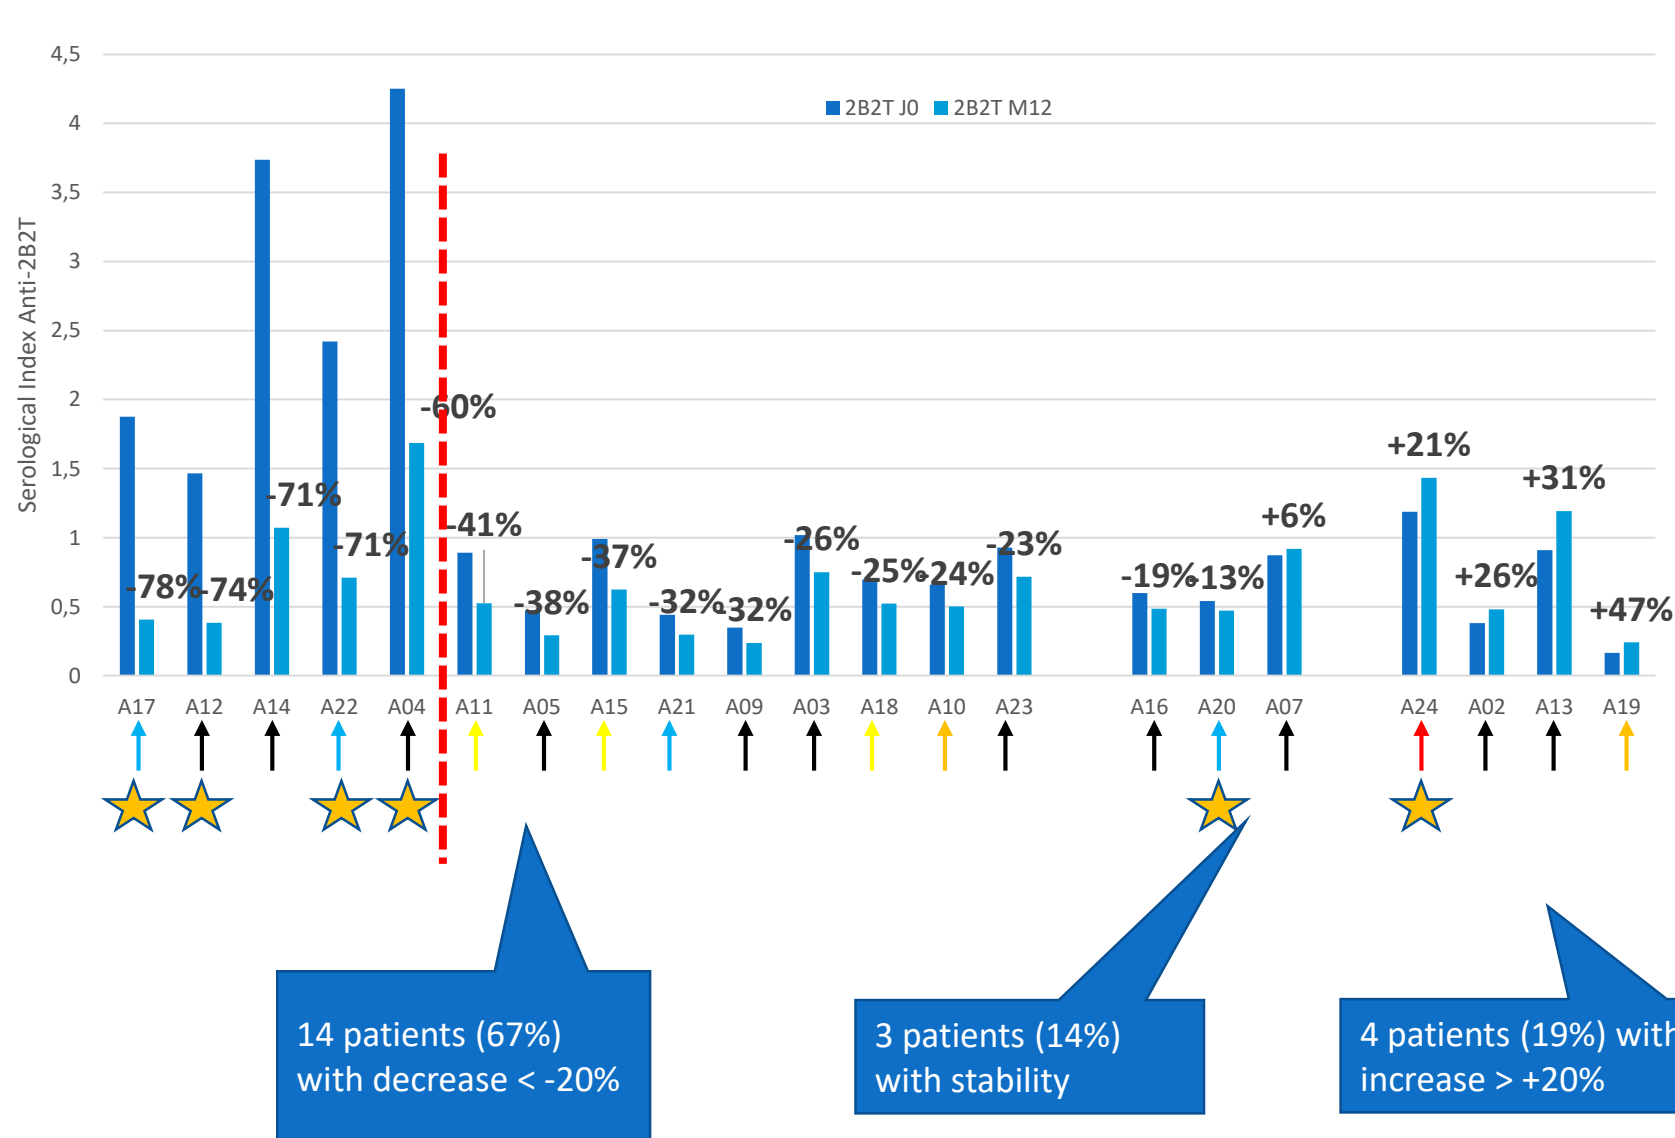

5 patients (29%)  
with decrease < -20%

10 patients (59%)  
with stability

2 patients (12%) with  
increase > +20%

- ↑ One pulmonary cyst completely removed
- ↑ One cyst (liver or other) completely removed
- ↑ Two cysts (one liver and one lung) completely removed
- ↑ Two cysts (one liver and one lung) **NOT** completely removed
- ↑ Nine pulmonary cysts **NOT** completely removed
- ★ History of CE

- ↑ One pulmonary cyst completely removed
- ↑ One cyst (liver or other) completely removed
- ↑ Two cysts (one liver and one lung) completely removed
- ↑ Two cysts (one liver and one lung) **NOT** completely removed
- ↑ Nine pulmonary cysts **NOT** completely removed
- ★ History of CE

Correspondance B2T /  
2B2T and Bordier kit

Good  
correlation /  
important  
decrease

Good correlation

↓  
✓ 12/21

No peak in immunoreactivity at M1 for Bordier & B2T/2B2T

**Majority** of patients with :

- a **decrease** of Ab levels for Bordier & B2T/2B2T
- a **stability** of Ab levels for Malate dehydrogenase and Citrate synthase.

12/21 (57%) = good match btw the 5 tests.

Particularly Bordier and tests with B2T and 2B2T

Strategy to identified MDH & CS  $\neq$  Bordier & B2T/2B2T

MDH & CS = initially developed for paediatric population (no chemical treatment)

- Immunoreactivity in adult population
- all treated with albendazole

No relapsed patients among the 23, no evaluation of probability of being « relapse free » vs « relapsed ».

Follow-up at 3 years post-surgery; in process...

Iterative comparison best strategy than status positive/negative.  
Samples at DO and M1 post-surgery necessary

ELISA kit commercialized by Bordier seems to be informative.

Test other samples retrospectively collected from  
plasma collection CNR-Echinococcoses (Besançon, France)

**Thanks to  
Maria Mar SILES LUCA  
For providing us  
B2T and 2B2T antigens**
